# Uninstall Helm On Ubuntu

To completely uninstall Helm and remove all traces, including data and configurations, you can follow these steps:

## 1. Uninstall Helm CLI

*First, if you installed Helm using a package manager, remove it:*

```
sudo apt-get remove --purge helm
```

```
sudo apt-get autoremove --purge
```

*If you manually installed Helm (via a binary):*

*Simply remove the Helm binary from the system:*

```
sudo rm /usr/local/bin/helm
```

## 2. Remove Helm Data and Configurations

*Helm stores data in a few directories and files that need to be removed manually:*

*Helm configuration directories:*

```
rm -rf ~/.helm
```

*Helm repositories:*

*If you've added repositories to Helm, those configurations are stored in:*

```
rm -rf ~/.config/helm
```

*Helm cache and local storage:*

```
rm -rf ~/.cache/helm
```

```
rm -rf ~/.local/share/helm
```

### ***Helm release data:***

*If you've used Helm to install charts, there may be release data in the Kubernetes cluster as well. You can delete them with:*

```
kubectl delete secrets -l "owner=helm"
```

```
kubectl delete configmaps -l "owner=helm"
```

## **3. Optional: Remove Helm-Related Kubernetes Resources**

*If you also want to remove Helm-related resources from your Kubernetes cluster, you can:*

### ***Delete the Helm Tiller (if you were using Helm v2):***

```
kubectl delete deployment tiller-deploy -n kube-system
```

### ***Clean up any Helm release data from the cluster:***

```
kubectl delete namespaces -l 'name=helm'
```

## **4. Verify Removal**

*Finally, verify that Helm has been completely removed:*

```
helm version
```

*\* This should return command not found if it's completely uninstalled \**

This should fully remove Helm and all related data from your Linux system.
